Work summary

Kharka Farm OS · Livestock monorepo · 6 Oct 2026
Live at `https://evoqedlivestockfarm.vercel.app` · Commit `f5a5bcd`, pushed to `main`

> **In one paragraph.** Today the farm app gained four things. Each person can now save a **Nepali mobile number** and receive urgent reminders by **SMS through Sparrow SMS**. Reminders now go to the **right people by role**: crucial ones reach the admin and everyone else, and day-to-day field jobs go only to workers. On mobile, tapping the round **profile icon** shows the person's account details instead of logging them out. And the admin has a **member management screen** (a small CMS) to edit, deactivate, reset passwords for, and remove the people on their farm. We also connected the live Vercel address everywhere it was needed, fixed several Expo Go problems on the emulator, and produced the notification-reminders PDF.

1. Deployment and the live address

- **Production checked:** the website and API at `evoqedlivestockfarm.vercel.app` respond and are healthy.
- **Address set where needed:** the API now allows requests from the live site (`CORS_ORIGIN`), and `docs/deployment.md` uses the real URLs.
- **Vercel settings list:** a ready-to-paste list of environment variables was generated in `apps/api/.env.vercel`. It holds secrets, so git ignores it and it is never committed.
- **Git safety confirmed:** `.gitignore` already excludes every `.env` file and the `.vercel/` build folder, so `git add .` is safe. Only the `.env.example` templates are tracked.

2. SMS alerts with a phone number

Phone number field

- **Web:** an "SMS alerts" card at the top of the Inbox where each person saves their own number.
- **Mobile:** the same card in the Inbox and inside the new profile sheet.
- **Admin:** a phone field when adding a member and when editing one.
- **Validation:** only Nepali mobiles are accepted: 10 digits starting with 98, 97 or 96. People can type `98XXXXXXXX`, `+977…` or with spaces; it is stored in the international form `+97798XXXXXXXX`.

Sparrow SMS

Sparrow SMS was chosen as the best Nepali provider: it is cheaper and more reliable for NTC and Ncell numbers than an international service. The API picks a provider automatically:

When these are set	What happens
`SPARROW_SMS_TOKEN` and `SPARROW_SMS_FROM`	SMS is sent through Sparrow SMS.
Twilio settings only	SMS is sent through Twilio (kept as a backup option).
Neither	Nothing is sent; the message is only written to the server log. Push notifications still work.

SMS is used only for the most urgent reminders, as described in the notification-reminders PDF.

3. Who gets which reminder

Before today every member received every reminder. Now each reminder is sent according to its priority and type:

Reminder	Who receives it
Critical (any type)	Everyone on the farm: admin, manager, workers, and the vet if it is a health task.
Assigned to a person	Only that person. They always receive their own task.
Management (milk yield drop, stock reorder and expiry, tank variance, breeding decisions, expense approval, unpaid sales)	Admin and manager.
Field work (everything else: colostrum, heat checks, feeding, calving follow-ups and similar)	Workers only. If the farm has no workers it goes to the manager, and if there is no manager, to the admin.
Health tasks (urgent vet call, treatment follow-up, pregnancy check, calf health check, no-heat vet visit)	The vet, but only when the task is critical or nobody is assigned.
Cooperative accounts	Never receive farm reminders.
Deactivated people	Never receive reminders.

4. Mobile profile sheet

Tapping the round initial icon in the top bar used to log the person out immediately. It now opens a sheet with their name, email, role, farm and farm mode, connection status, and their SMS phone number. **Sign out** is a separate red button inside the sheet, so nobody is logged out by accident.

5. Admin member management (CMS)

On web this is **Admin → Members**; on mobile, the Admin screen. The admin can:

- **See everyone** with their name, email, phone, role, active status and last sign-in, plus a count of total and active people.
- **Search and filter** by name, email or phone, by role, and by active or inactive.
- **Edit a person:** name, email, phone, role, whether they can sign in, and voice-call alerts.
- **Reset a password:** sets a new temporary password and signs the person out on every phone and computer.
- **Remove from the farm:** after a confirmation. Their past records stay; tasks assigned to them become unassigned. If this was their only farm, their account is also deactivated.
- **Add members** with name, email, phone, role, temporary password and voice alerts.

Safety rules enforced by the server

Rule	What it prevents
No self-lockout	An admin cannot change their own role, deactivate themselves or remove themselves. Their row is marked "You".
Always one admin	The farm must keep at least one active admin.
Shared accounts	If a person also belongs to another farm, only they can change their email or password.
Unique email	Two people cannot share one email address.
Sessions revoked	A password reset or deactivation signs the person out everywhere straight away.
Audit log	Every add, edit, password reset and removal is recorded in Admin → Audit.

API endpoints

Endpoint	Purpose
`GET /v1/farms/me/members`	List the farm's people.
`POST /v1/farms/me/members`	Add a person.
`PATCH /v1/farms/me/members/:userId`	Edit details, role, status, or reset the password.
`DELETE /v1/farms/me/members/:userId`	Remove a person from the farm.
`PATCH /v1/auth/me`	Anyone updates their own name and phone number.

6. Expo Go fixes on the emulator

- **"Unable to resolve expo-notifications" and an old API address:** Metro was stuck waiting at an "Install recommended Expo Go version?" prompt and kept serving an old bundle. Restarting it fixed this.
- **"Something went wrong" in Expo Go:** it was opening a saved project at an old Wi-Fi address. The PC's address changes, so the app is now opened at `exp://10.0.2.2:8081`, the emulator's fixed address for the PC.

7. Quality checks

Check	Result
Typecheck (all packages)	**PASS**

Tests	**316 PASS** API 250 · web 30 · mobile 20 · contracts 16
Lint	**0 ERRORS** 8 older warnings in other pages; none in the new files

New tests cover member management (10), reminder routing by role (6), Sparrow SMS sending, and phone-number validation.

8. Documents produced

- `docs/notification-reminders.pdf` : how reminders work, now including the "who gets which reminder" table and Sparrow SMS.
- `docs/work-summary-2026-10-06.pdf` : this document.

9. Still to do

Status	Task
DONE	Commit and push today's work (commit `f5a5bcd`).
TO DO	In Vercel, add `SPARROW_SMS_TOKEN` and `SPARROW_SMS_FROM`, plus `FCM_SERVICE_ACCOUNT_JSON` and `NOTIFICATION_CRON_SECRET`, then redeploy. Values are listed in `apps/api/.env.vercel`.
TO DO	In GitHub, add secrets `API_BASE_URL` and `NOTIFICATION_CRON_SECRET` and the variable `ENABLE_NOTIFICATION_CRON=true`, so reminders are dispatched on schedule.
TO DO	Rotate the Firebase (FCM) private key, because it was shared in chat.
TO DO	Sign in again on the emulator.

Known limits on Vercel. The hourly and nightly checks have no automatic trigger yet, and uploaded files (photos, receipts) are stored on the server's temporary disk, so they are lost on each redeploy. Both need a follow-up: a scheduled trigger, and cloud file storage.
